                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present sequence represents an antisense oligonucleotide directed against the human telomerase RNA component gene sequences. The oligonucleotide can be used as an affinity agent in the methods of the invention, which are used to purify human telomerase. The methods involve the use of several sequential steeps, including the use of two matrixes that bind molecules bearing negative charges, a matrix that binds molecules bearing positive charges, an affinity purification step and a size separation. Telomerase, an affinity purificancer therapies, and is useful in assays for characterizing (pre) cancerous cells. Telomerase can also be used to screen for specific modulators, for blochemical analysis of its activity, and in preparation of antibodies. Fragments of telomerase, or nucleic acid encoding them, are used in vaccines, and for treating over expression of telomerase,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Purification of telomerase on affinity material diagnosis and treatment of cancer
                                                                                                                                                                                                                                                                                                                                               immune system
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 20 BP; 0 A; 9 C; 4 G; 7 T; 0 other;
Claim 11; Page 65; 80pp; English.
                        New polynucleotide(s) anti:sense to human telomerase - used detecting or inhibiting human telomerase, e.g. for treating contraception, immuno-suppression or treating infection
                                                                                                                                                                         20-DEC-1996;

CC Sequences shown in AAV41169 to AAV41181 represent antisense
CC oligonuclectides to the RNA component of human telomerase (hTR). These
CC antisense oligonuclectides specifically hybridise to a nucleotide
CC sequence within an accessible region of the hTR, but that does not
CC hybridise to a sequence within the template region of hTR. These
CC component of human telomerase in a sample. This is useful for diagnosing
CC cancer (especially neuroblastoma, bladder, colon and prostate cancer),
CC and providing prognosis for a cancer patient. The inhibitory
CC oligonuclectides can inhibit the telomerase activity level in a cell by
CC oligonuclectides can inhibit the telomerase activity level in a cell by
CC of the RNA component into the telomerase activity, inhibiting the
CC of the RNA component into the telomerase holeonryme, or inhibiting the
CC of the RNA component into the telomerase holeonryme, or inhibiting the
CC objymerase activity of telomerase activity in both cultured cells and in
CC cells in vivo. They can be used in therapeutice for treating or
CC immunosuppression, and for selectively down-regulating specific branches
CC of the immune system, e.g. a specific subset of T-cells, in
CC nariation or functions or for treating infections by, e.g. yeast,
CC nariation or functions or for treating infections by, e.g. yeast,

Compositions comprising human telomerase, useful i associated with overexpression of telomerase $e\cdot g\cdot$ for treating diseases . cancer -

Disclosure; Column 45-46; 34pp; English.

This invention describes a novel composition comprising human telomerase having at least 2000-fold (preferably at least 60000-fold) increased relative purity compared with crude extract of cells from

iı.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Matches
                                                        This invention describes a novel composition comprising human telomerase having at least 2000-fold (preferably at least 60000-fold) increased relative purity compared with crude extract of cells from adenovirus-transformed kidney cell line. The composition is useful for eliciting an immune response in animals and may therefore be used as a vaccine for treating diseases associated with the overexpression of telomerase e.g. cancer. ARZ3662-Z3637 represent oligonucleotides used in the isolation of human clone 28-1 which contains a fragment of the human telomerase described in the method of the invention.

                                                                                                       for inducing a humoral or cell-mediated immune response in an animal. Purified telomerase or immunogenic fragments are useful as vaccines for treating diseases associated with over-expression of telomerase, such as cancer and for producing antibodies that recognize telomerase, which are useful as affinity agents in isolating the proteins and for detecting the presence of proteins in a sample, such as cell or tissue. Identification of telomerase aids in diagnosis of cancer or pre-cancerous states. Telomerase and/or telomerase associated proteins agents that alter the association of telomerase-associated proteins, such as nucleolin or EF2H with
                                                                        Sequence
                                                                                                                                                                                                                                                                 to a purified human 2000-fold increased
                                                                                                                                                                                                                             with telomerase RNA component has DNA polymerase activity and a molecular weight of 200-2000 kilo Daltons (kDa). The purified telomerase is useful
                                                                                                                                                                                                                                                   the purification of human telomerase. The invention relates
to a purified human telomerase core enzyme protein comprising
2000-fold increased purity compared with a crude extract of cells from
adenovirus-transformed kidney cell line (293 cells) and when associated

                                                                                                                                                      The sequence represents a biotinylated antisense oligonucleotide CC used in the purification of human telomerase. The invention comprising CC relates to a purified human telomerase. The invention comprising CC 2000-fold increased purity compared with a crude extract of cells from adenovirus-transformed kidney cell line (293 cells) and when associated CC which telomerase RNA component has DNA polymerase activity and a molecular complete the component of the purified telomerase is useful CC purified telomerase or immunogenic fragments are useful as vaccines for treating diseases associated with over-expense in a naimal. CC treinducing a humoral or cell-mediated immune response in a vaccines for treating diseases associated with over-expension of telomerase, such as CC cancer and for producing antibodies that recognize telomerase, which are CC useful as affinity agents in isolating the proteins and for detecting the presence of proteins in a sample, such as cell or tissue. Identification CC of telomerase and/or telomerase ansociated proteins are also useful for CC telomerase and/or telomerase associated proteins are also useful for CC telomerase-associated proteins, such as nucleolin or EF2H with

                                                                                                  CC oligonucleotides to the RNA component of human telomerase (hTR). These CC antisense oligonucleotides specifically hybridise to a nucleotide sequence within an accessible region of the hTR, but that does not conjuncted to a sequence within the template region of hTR. These CC hybridise to a sequence within the template region of hTR. These CC oligonucleotides may specifically be used for detection of an RNA camponent of human telomerase in a sample. This is useful for diagnosing CC cancer (especially neuroblastoma, bladder, colon and prostate cancer), CC and providing prognosis for a cancer patient. The inhibitory can disponucleotides can inhibit the telomerase activity level in a cell by conjuncted the telomerase RNA component transcript, inhibiting assembly confire ferring with transcription of the RNA component transcript, inhibiting the colorerase RNA component transcript, inhibiting the colorerase colorerase activity in both cultured cells and in CC be used for inhibiting telomerase activity in both cultured cells and in CC cells in vivo. They can be used in therapeutics for treating or cells in vivo. They can be used in therapeutics for treating contaction, and for selectively down-regulating specific branches cof the immune system, e.g. a specific subset of T-cells, in contacted contact
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Synthetic.

                                                                                                                                                                                                                                                                      construction of the plasmid of the invention. The plasmid contains a DNA sequence encoding the protein TSP-1 in conjunction with a DNA molecule with gene expression regulation activity. The plasmid is used for regulation of gene expression, and treatment of viral infection pref. human T-cell leukaemia and HIV. The plasmid also encodes a protein which is used as an antivirus agent, and also in a method for detecting cancer. The DNA molecule and protein have potential uses in gene therapy, and the plasmid may also have potential use in the treatment of TSP.
                                                                                                                                                                                                                                                                                                                                                                                                                e.g.

This mutation also introduces a new HhaI site (GCGC at nucleotides 427-430), so that HhaI cleavage of a PCR prod. amplified from a mutant template produces 68 and 43 nucleotide subfragments, which can be detected by gel electrophoresis separation, followed by radioactive probe hybridisation. This assay can be used to diagnose the presence of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Ś
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              CC A method for determining whether a human tissue is neoplastic comprises CC detecting an alteration in the amino acid sequence of the p53 proteins in CC a neoplastic tissue and wild type tissue by comparing binding of a CC memoclonal antibody to the two p53 proteins and detecting loss of binding CC in the mutant compared to the wild type protein Alternatively a mutation CC may be detected by testing the ability of the p53 proteins to bind an CC antigen. Several genetic alterations occur during colorectal tumour CC formation, the most common of which are deletions of the short arm of CC p53 gene occur in a wide variety of cancers. The method of the invention CC is useful for the diagnosis of neoplastic tissues such as lung, breast, CC brain, colorectal, bladder, mesenchyme, prostate or stomach tumours and CC fine present sequence represents a PCR primer used to amplify a fragment CC of the human p53 gene from a tumour which has an allelic deletion of CC that the tumour carries a point mutation at codon 143 of the p53 gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Query Match

The invention relates to detection of variation in the human p53 gene with an antibody which specifically react with human p53 protein by steps of: immunological detection of a sample with immunological staining; separation of stained and un-stained cells; extraction of genome DNA from stained cells; extraction of genome DNA from stained an area of variation of human p53 gene from the genome DNA obtained in the preceding extraction step; and analysis of the reaction product.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 21 BP; 2 A; 9 C; 2 G; 8 T; 0 other;
                                                                     2 PCR primers (AAT72696-97) were used to amplify a 1.0 kb DNA segment comprising nuclectides 2385-3410 of a Saccharopolyspora erythraea gene segment (AAT72684), covering the eryBli gene that encodes an enzyme (AAW19736) involved in L-mycarose biosynthesis. The amplified DNA was utilised in the construction of plasmid pXB4 and hence of plasmid pXB6, which was used to transform Streptomyces antibioticus ATCC 11891, resulting in prodn. of the novel polyketide 3-des-oleandrosyl-3-mycarosyl oleandomycin.
                                                                                                                                                                                                                                                                                                                                                                                                                                     New genes involved in sugar biosynthesis and attachment - used generate polyketide antimicrobials etc. with altered pattern of glycosylation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Polyketide; glycosylation; eryBII; L-mycarose; antimicrobial; antibiotic; antifingal; fungicide; anticancer; cytostatic; antibelmintic; Saccharopolyspora erythraea; primer; PCR; polymerase chain reaction; pXB6; oleandomycin; 88.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sugar biosynthesis gene eryBII PCR primer.

                                                                                                                                                                                                               proteins, cytochromes, kinesins, cytokines, interferons, interleukins, 6-protein coupled receptors and thioesterases. The present sequence is one such oligonucleotide. The oligonucleotides and the peptides encoded by them may be used in the prevention, diagnosis and treatment of diseases associated with inappropriate expression of the proteins listed above. Disorders that may be prevented, diagnosed and/or treated include multifactorial diseases with a genetic component, such as autoimmune diseases (e.g. rheumatoid arthritis, multiple sclerosis, diabetes, systemic lupus erythromatosus and Grave's disease), inflammation, cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Polymorphic nucleic acids encoding e.g. amylases, oncogenes and histones, useful for diagnosing and cancer, autoimmune diseases and infections -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    neuroprotective; antimicrobial; gene therapy; vaccine; amylase; cancer; amyloid protein; angiopoietin; apoptosis related protein; cadherin; cyclin; polymerase; oncogene; histone; kinase; colony stimulating factor;

                                                                                                                CC hybridise to a sequence within the template region of hTR. These CC oligonucleotides may specifically be used for detection of an RNA CC component of human telomerase in a sample. This is useful for diagnosing CC cancer (especially neuroblastoma, bladder, colon and prostate cancer), and providing prognosis for a cancer patient. The inhibitory CC oligonucleotides can inhibit to the telomerase activity level in a cell by interfering with transcription of the RNA component, decreasing the CC of the RNA component into the telomerase holoenzyme, or inhibiting assembly CC of the RNA component into the telomerase holoenzyme, or inhibiting the CC of the RNA component into the telomerase holoenzyme, or inhibiting the CC oligonary of telomerase. These antisense oligonacleotides can be used for inhibiting telomerase activity in both cultured cells and in CC cells in vivo. They can be used in therapeutics for treating or cells in vivo. They can be used in therapeutics for treating or the immunosuppression, and for selectively down-regulating specific branches of the immune system, e.g. a specific subset of T-cells, in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequences shown in AAV41169 to AAV41181 represent antisense oligonucleotides to the RNA component of human telomerase (hTR). The antisense oligonucleotides specifically hybridise to a nucleotide sequence within an accessible region of the hTR, but that does not
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Claim 11; Page

                                                                                                                                                                                         AAQ71911 to AAQ71975 are primers for the human IL-2R gammma gene, these were used to amplify DNA from mutated and normal IL-2R gamma genes. The mutated gene DNA was obtained either from female carriers or male sufferers of x-linked severe combined immunodeficiency (XSCID). The amplified DNA from normal and affected individuals was then compared using a variety of methods including northern blotting and dot and slot hybridisation. From this a claimed method for the diagnosis of XSCID carriers and sufferers was developed.
                                                                                                                                                                                                                                                                                                                                                  Diagnosis of X-linked severe combined immunodeficiency (XSCID) comprises detecting mutated IL-2R gamma gene, also vectors and transgenic animals containing the mutated gene

```

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequences shown in ANV41169 to ANV41181 represent antisense CC oligonucleotides to the RNA component of human telomerase (hTR). These CC antisense oligonucleotides specifically hybridise to a nucleotide gequence within an accessible region of the hTR, but that does not hybridise to a sequence within the template region of hTR. These CC oligonucleotides may specifically be used for detection of an RNA CC component of human telomerase in a sample. This is useful for diagnosing CC cancer (especially neuroblastoma, bladder, colon and prostate cancer), and providing prognosis for a cancer patient. The inhibitory CC oligonucleotides can inhibit the telomerase activity level in a cell by interfering with transcription of the RNA component, decreasing the CC oligonucleotides can inhibit the telomerase activity level in a cell by CC oligonucleotides can inhibit the telomerase activity or inhibiting assembly CC of the RNA component into the telomerase holoenzyme, or inhibiting the CC oligonucleotides can be used for inhibiting telomerase. These antisense oligonucleotides can CC cells in vivo. They can be used in therapetucies for treating or preventing cancer, for contraception or sterilisation, for CC immunosuppression, and for selectively down-regulating specific branches CC of the immune system, e.g. a specific subset of T-cells, in CC anti-inflammatory therapies or for treating infections by, e.g. yeast, XX
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match

The present sequence represents an antisense oligonucleotide directed against the human telomerase RNA component gene sequences. The oligonucleotide can be used as an affinity agent in the methods of the invention, which are used to purify human telomerase. The methods involve the use of several sequential steps, including the use of two matrixes that bind molecules bearing negative charges, an matrix that binds molecules bearing regative charges, an affinity purification step and a size separation. Telomerase is a particular target of anticancer therapies, and is useful in assays for characterizing (pre) cancerous cells. Telomerase can also be used to screen for specific modulators, for biochemical analysis of its activity, and in preparation of antibodies. Fragments of telomerase, or nucleic acid encoding them, are used in vaccines, and for treating over expression of telomerase, particularly in cancer.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              oligonucleotides may specifically be used for detection of an RNA component of human telomerase in a sample. This is useful for diagnosing cancer (especially neuroblastoma, bladder, colon and prostate cancer), and providing prognosis for a cancer patient. The inhibitory oligonucleotides can inhibit the telomerase activity level in a cell by interfering with transcription of the RNA component, decreasing the half-life of the telomerase RNA component transcript, inhibiting assembly of the RNA component into the telomerase transcript, inhibiting the polymerase activity of telomerase. These antisense oligonucleotides can be used for inhibiting telomerase activity in both cultured cells and in cells in vivo. They can be used in therapeutics for treating or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sequences shown in AAV41169 to AAV41181 represent antisense oligonucleotides to the RNA component of human telomerase (hTR). The antisense oligonucleotides specifically hybridise to a nucleotide sequence within an accessible region of the hTR, but that does not hybridise to a sequence within the template region of hTR. These
                                                Compositions comprising human telomerase, useful associated with overexpression of telomerase e.g

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 ક
                                                                                                                                                                                                                                                                                                                The sequence represents an antisense oligonuclectide used in the purification of human telomerase. The invention relates to a purified human telomerase ore enzyme protein comporising 2000-fold increased purity compared with a crude extract of cells from adenovirus-transformed kidney cell line (293 cells) and when associated with relomerase RNA component has DNA polymerase activity and a molecular weight of 200-2000 kilo Daltons (kDa). The purified telomerase is useful for inducing a humoral or cell-mediated immune response in an animal. CC purified telomerase or immunogenic fragments are useful as vaccines for treating diseases associated with over-expression of telomerase, which are cancer and for producing antibodies that recognize telomerase, which are useful as affinity agents in isolating the proteins and for detecting the cuseful as affinity agents in isolating the proteins and for tissue. Identification of telomerase and/or telomerase associated proteins are also useful for screening compounds to identify agents that alter the association of telomerase-associated proteins, such as nucleolin or EF2H with

The invention CC used in the purification of human telomerase. The invention CC 2000-fold increased purity compared with a crude extract of cells from CC 2000-fold increased purity compared with a crude extract of cells from CC weight of 200-2000 kilo Daltons (kDa). The purified telomerase is useful CC weight of 200-2000 kilo Daltons (kDa). The purified telomerase is useful CC for inducing a humoral or cell-mediated immune response in an animal. CC treating diseases associated with over-expression of telomerase, which are CC useful as affinity agents in isolating the proteins and for detecting the CC useful as affinity agents in isolating the proteins and for telomerase in a sample, such as cell or tissue. Identification CC of telomerase aids in diagnosis of cancer or pre-cancerous states. CC Telomerase associated proteins, such as nucleolin or EF2H with

                                                                                                                                                                                                                                                                                                                      infection pref. human T-cell leukaemia and HIV. The plasmid also encode a protein which is used as an antivirus agent, and also in a method for detecting cancer. The DNA molecule and protein have potential uses in gene therapy, and the plasmid may also have potential use in the treatment of TSP.
                                                                                                                                                                                                                                                                                                                                                                                   The sequences given in AAT42904-16 are primers which were used in the construction of the plasmid of the invention. The plasmid contains a DNA sequence encoding the protein TSP-1 in conjunction with a DNA molecule with gene expression regulation activity. The plasmid is used for regulation of gene expression, and treatment of viral

This mutation also introduces a new HhaI site (GCGC at nucleotides 427-430), so that HhaI cleavage of a PCR prod. amplified from a mutant template produces 68 and 43 nucleotide subfragments, which can be detected by gel electrophoresis separation, followed by radioactive probe hybridisation. This assay can be used to diagnose the presence of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    á
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       A method for determining whether a human tissue is neoplastic comprises CC detecting an alteration in the amino acid sequence of the p53 proteins in CC a neoplastic tissue and wild type tissue by comparing binding of a composition antibody to the two p53 proteins and detecting loss of binding CC in the mutant compared to the wild type protein. Alternatively a mutation CC may be detected by testing the ability of the p53 proteins to bind an CC antigen. Several genetic alterations occur during colorectal tumour CC formation, the most common of which are deletions of the short arm of CC p53 gene occur in a wide variety of cancers. The method of the invention CC is useful for the diagnosis of neoplastic tissues such as lung, breast, colorectal, bladder, mesenchyme, prostate or stomach tumours and CC brain, colorectal, bladder, mesenchyme, prostate or stomach tumours and CC of the present sequence represents a PCR primer used to determine CC of the human p53 gene from a tumour which has an allelic deletion of CC chromosome 17p, yet still expresses p53. The primer is used to determine two that the tumour carries a point mutation at codon 143 of the p53 gene.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Query Match

                                                                     2 PCR primers (AAT72696-97) were used to amplify a 1.0 kb DNA segment comprising nucleotides 2385-3410 of a Saccharopolyspora erythraea gene segment (AAT72684), covering the eryBlI gene that encodes an enzyme (AAM19736) involved in L-mycarose biosynthesis. The amplified DNA was utilised in the construction of plasmid pXB6, which was used to transform Streptomyces antibioticus ATCC 11891, resulting in prodn. of the novel polyketide 3-des-oleandrosyl-3-mycarosyl oleandomycin.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present sequence is that of a PCR primer for detection of variation in the human p53 gene useful to the invention. The invention relates to detection of variation in the human p53 gene with an antibody which specifically react with human p53 protein by steps of: immunological detection of a sample with immunological staining; separation of stained and un-stained cells; extraction of genome DNA from stained cells; PCR amplification of a p53 DNA fragment which may contain an area of variation of human p53 gene from the genome DNA obtained in the preceding extraction step; and analysis of the reaction product.
                                                                                                                                                                                                                                                                                                                                                                                                                                          New genes involved in sugar biosynthesis and attachment - used generate polyketide antimicrobials etc. with altered pattern of glycosylation
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Polyketide; glycosylation; eryBII; L-mycarose; antimicrobial; antibiotic; antifungal; fungicide; anticancer; cytostatic; antihelmintic; Saccharopolyspora erythraea; primer; PCR; polymerase chain reaction; pXB6; oleandomycin; ss.
